

Kivi Application: Product UI/UX Design

Product Position

Every voice-to-text tool in the market competes on productivity - faster translation, better context understanding and more customisable speech styles. But in such a saturated market, technical edges are short-lived and cannot effectively act as leverage over competitors.

India brings together people from vastly different linguistic and cultural backgrounds, yet schools, workplaces and social spaces often push us towards one common language, despite our natural tendency to mix languages, dialects and slang.

Kivi treats this code-switching not as noise, but as a natural part of how multilingual Indians think and communicate. By preserving the essence of these thoughts while enabling communication across linguistic boundaries, Kivi moves beyond productivity to become a tool for free self-expression.
